

Analysis on Information Dissemination about Domestic Waste Disposal

By YANG Changjiang

Abstract:

For any industry, information dissemination leads the direction of the right of speech. In China, there are complete opposite public opinion fields regarding the ways to manage domestic waste. The industry thinks that waste incineration, which is right in its golden period of development, creates no pollution and poses no harm to human health. However, the general public strongly questions the infiltration pollution of solid waste landfill, and is concerned over issues including the low standards in waste incineration pollution control, high level pollution emission, aggravated global warming, and other harms to human health. Domestic waste incineration and landfill are big issues that will have worldwide impact. Those distorted information dissemination must be cleared and set right. The future information dissemination regarding domestic waste disposal should go into the direction of leading to a compulsory garbage sorting system that is in conformity with China's situation, and lead to a technical path of resource utilization.

Key words: domestic waste disposal, information dissemination
